

## ABSTRACT

5

The invention relates to a method and system for enabling a  
callback from an entity to an equipment initiating a session  
wherein nodes involved in handling the session, are adapted  
10 to store information for the session, preferably for a  
predetermined time from the beginning of the session. The  
information includes an address of at least one other node in  
the signalling path, and may also include an identity of the  
equipment. The at least one other node will be used, in case  
15 of callback, to carry signalling related to callback from the  
entity to the equipment. Preferably, signalling bearer for  
establishing the session is maintained for a certain time  
from the beginning of the signalling bearer activation. The  
nodes preferably are IMS nodes and include P-CSCF, S-CSCF, or  
20 MGCF node.
